R<sup>2</sup> represents H or C<sub>1-6</sub> alkoxy optionally substituted by one or more fluorine atoms;

15 R<sup>3</sup> represents one or more groups independently selected from H, halogen, C<sub>1-4</sub> alkoxy and CF<sub>3</sub>;

R<sup>4</sup> represents a 4-, 5- or 6-membered heterocyclic ring containing 1 or 2 heteroatoms  
 20 selected from N, O and S, the ring being optionally fused to a benzene ring or a 5- or 6-membered heterocyclic ring containing 1 or 2 heteroatoms selected from N, O and S, the ring system as a whole being optionally substituted by one or more groups independently selected from OH, C<sub>1-4</sub> alkyl, C<sub>1-4</sub> alkoxy, halogen, SO<sub>2</sub>NR<sup>8</sup>R<sup>9</sup> and NHSO<sub>2</sub>(C<sub>1-4</sub> alkyl), and when S is a member of the ring system, it may be substituted by one or two oxygen atoms;

25 R<sup>8</sup> and R<sup>9</sup> independently represent H or C<sub>1-4</sub> alkyl;

X represents CH or N; and

L is absent,

5

in which  $R^{1-3}$ ,  $R^6$ ,  $R^7$ , X, m, n and p are as defined above, with a compound of formula XIV,

in which  $R^4$  is as defined above, A' represents CO or SO<sub>2</sub> and Lg represents a leaving group;

10

(h) when  $R^2$  and one  $R^3$  group together represent  $-\text{OCH}_2-$ , cyclization of a compound of formula XXXI,

10 in which  $R^1$ ,  $R^4$ , X and L are as defined above, and  $R^{3a}$  has the same meaning as  $R^3$  above except that  $R^2$  and an  $R^{3a}$  group do not together represent  $-\text{OCH}_2-$ ; and where desired or necessary converting the resulting compound of the invention into a pharmaceutically acceptable salt or vice versa.

15 In process (a), the cyclization may be carried out in the presence of a strong base (for example lithium diisopropylamide) in a solvent which does not adversely affect the reaction (for example tetrahydrofuran) around room temperature and quenched with water.

In process (b), suitable leaving groups are OH and Cl. When the compound of formula  
 20 XIV is a carboxylic acid, the reaction may be carried out in the presence of conventional coupling agents [for example 1-hydroxybenzotriazole monohydrate, 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride and 4-methylmorpholine] in a solvent which does not adversely affect the reaction (for example  $\text{CH}_2\text{Cl}_2$ ) at or around room temperature. When the leaving group is Cl, the reaction may be carried out in a  
 25 solvent which does not adversely affect the reaction (for example  $\text{CH}_2\text{Cl}_2$ ) around  $0^\circ\text{C}$ .

In process (c), the reaction may be carried out in the presence of a palladium catalyst [for example tetrakis(triphenylphosphine)palladium] in a solvent which does not adversely

affect the reaction (for example a mixture of toluene, ethanol and 1N aqueous sodium carbonate) at an elevated temperature (for example the reflux temperature of the solvent).

In process (d), the reaction may be carried out in a solvent which does not adversely affect  
5 the reaction (for example n-butanol) in the presence of a base (for example triethylamine) at an elevated temperature (for example 100°C).

In process (e), suitable leaving groups include Cl. The reaction may be carried out in a solvent which does not adversely affect the reaction (for example THF) in the presence of a  
10 base (for example triethylamine) at room temperature.

The reaction may also be carried out without isolating the compound of formula XXVIIIa or XXVIIIb, by reacting a compound of formula XIIIa or XIIIb with triphosgene and a compound of formula XXIX. In this case the leaving group is -Cl. The reaction may be  
15 carried out in a solvent which does not adversely affect the reaction (for example CH<sub>2</sub>Cl<sub>2</sub>) in the presence of a base (for example triethylamine) at or around room temperature.

In process (f), suitable strong bases include lithium diisopropylamide. The reaction may be carried out in a solvent which does not adversely affect the reaction (for example THF).  
20

In process (g), the reaction may be carried out in a solvent which does not adversely affect the reaction (for example a mixture of n-BuOH and dimethylacetamide) in the presence of a base (for example triethylamine) at an elevated temperature (for example 80°C).

25 In process (h), suitable reagents are sodium carbonate with palladium acetate. The reaction may be carried out in a solvent which does not adversely affect the reaction (for example dimethylacetamide) at an elevated temperature (for example 130°C).

It will be apparent to those skilled in the art that in the processes described above [for  
30 example process (c)], and in the methods given below for preparation of the starting materials used in the above processes, when R<sup>2</sup> and R<sup>3</sup> are present in different molecules, they cannot together represent -OCH<sub>2</sub>-.

10

Compounds of formula XX may be prepared by reacting a compound of formula XXI,

20

Compounds of formula XXII [see process (d)] may be prepared from a compound of formula XXIV,

in which R<sup>1-3</sup> are as defined above, by reaction with a saturated solution of ammonia in

10 defined above using the reaction conditions described above for process (c), followed by reaction with POCl<sub>3</sub> and N,N-dimethylaniline.

Compounds of formula XXV may be prepared from a compound of formula XXVI,

15 in which R<sup>1</sup> and R<sup>2</sup> are as defined above, using conventional techniques.

Compounds of formula XXVIIIa and XXVIIIb [see process (e)] in which Lg represents Cl may be prepared from compounds of formula XIIIa or XIIIb, as appropriate, by reaction with triphosgene. The reaction may be carried out in a solvent which does not adversely  
20 affect the reaction (for example CH<sub>2</sub>Cl<sub>2</sub>) in the presence of a base (for example triethylamine) at around -10°C.

Compounds of formula XXXI [see process (h)] may be prepared from compounds of formula XXXII,

in which R¹, R⁴, L and X are as defined above, by reaction with a compound of formula

- 10 Compounds of formula XXXII are analogous to compounds of formula I, and may be prepared using analogous methods. For example, when X represents CH, the compounds may be prepared by cyclizing a compound analogous to those of formula X using process (a). When X represents N, the compounds may be prepared from a compound analogous to those of formula XXII and a compound of formula XXIIIa or XXIIIb, as appropriate, using  
15 process (d).

Compounds of formulae XI, XII, XIV, XVIIa, XVIIb, XIX, XXI, XXIIa, XXIIb, XXIII, XXVI, XXIX, XXX and XXXIII are either known or are available using known techniques.

20

The intermediate compounds of formulae X, XIIIa, XIIIb, XVIII, XXII, XXVIIIa, XXVIIIb and XXXI form a further aspect of the invention.

It will be apparent to those skilled in the art that sensitive functional groups may need to be  
25 protected and deprotected during synthesis of a compound of the invention. This may be

achieved by conventional techniques, for example as described in 'Protective Groups in Organic Synthesis' by T W Greene and P G M Wuts, John Wiley and Sons Inc, 1991.

The compounds of the invention are useful because they possess pharmacological activity in  
5 animals. In particular, the compounds are useful in the treatment of a number of conditions including hypertension, myocardial infarction, male erectile dysfunction, hyperlipidaemia, cardiac arrhythmia and benign prostatic hyperplasia. The latter condition is of greatest interest. Thus, according to another aspect of the invention, there is provided a method of treatment of benign prostatic hyperplasia which comprises administering a therapeutically  
10 effective amount of a compound of the invention to a patient suffering from such a disorder. The use of the compounds of the invention as pharmaceuticals, and the use of the compounds of the invention in the manufacture of a medicament for the treatment of benign prostatic hyperplasia, are also provided.

15 The compounds of the invention may be administered by any convenient route, for example orally, parenterally (e.g. intravenously, transdermally) or rectally. The daily dose required will of course vary with the particular compound used, the particular condition being treated and with the severity of that condition. However, in general a total daily dose of from about 0.01 to 10mg/kg of body weight, and preferably about 0.05 to 1mg/kg, is suitable,  
20 administered from 1 to 4 times a day.

The compounds of the invention will generally be administered in the form of a suitable pharmaceutical formulation. Thus, according to another aspect of the invention, there is provided a pharmaceutical formulation including preferably less than 50% by weight of a  
25 compound of the invention in admixture with a pharmaceutically acceptable adjuvant, diluent or carrier. The pharmaceutical formulation is preferably in unit dose form. Such forms include solid dosage forms, for example tablets, pills, capsules, powders, granules, and suppositories for oral, parenteral or rectal administration; and liquid dosage forms, for example sterile parenteral solutions or suspensions, suitably flavoured syrups, flavoured  
30 emulsions with edible oils such as cottonseed oil, sesame oil, coconut oil and peanut oil, and elixirs and similar pharmaceutical vehicles.

Solid formulations may be prepared by mixing the active ingredient with pharmaceutical carriers, for example conventional tableting ingredients such as corn starch, lactose, sucrose, sorbitol, talc, stearic acid, magnesium stearate, dicalcium phosphate, gums and other diluents, for example water, to form a homogeneous preformulation formulation in which the active  
5 ingredient is uniformly dispersed so that it may be readily subdivided into equally effective unit dosage forms containing typically from 0.1 to about 500mg of the active ingredient. The solid dosage forms may be coated or otherwise compounded to prolong the action of the formulation.

10 The formulations of the invention may also contain a human 5- $\alpha$  reductase inhibitory compound [see International Patent Application WO 95/28397], or a compound of the invention could be presented in a pharmaceutical pack also containing a human 5- $\alpha$  reductase inhibitory compound as a combined preparation for simultaneous, separate or sequential use.

15

The compounds of the invention may be tested in the screens set out below.

*Contractile responses of human prostate*

20 Prostatic tissue was cut into longitudinal strips (approximately 3x2x10 mm) and suspended in organ baths under a resting tension of 1 g in Krebs Ringer bicarbonate of the following composition (mM): NaCl (119), KCl (4.7), CaCl<sub>2</sub> (2.5), KH<sub>2</sub>PO<sub>4</sub> (1.2), MgSO<sub>4</sub> (1.2), NaHCO<sub>3</sub> (25), glucose (11), and gassed with 95% O<sub>2</sub>/5% CO<sub>2</sub>. The solution also contained 10 mM cocaine and 10 mM corticosterone. Tissues were  
25 exposed to a sensitising dose of (-)-noradrenaline (100 mM) and washed over a 45 minute period. Isometric contractions were obtained in response to cumulative additions of (-)-noradrenaline to obtain control curves in all tissues. A further curve was then generated in the presence or absence of antagonist (incubated for 2 hours). Antagonist affinity estimates ( $pA_2$ ) were determined using a single concentration of  
30 competing antagonist,  $pA_2 = -\log [A]/(DR-1)$  where the dose ratio (DR), relative to corresponding controls, was produced by a single concentration of antagonist [A], assuming competitive antagonism and Schild regression close to unity.

*Anaesthetised dog model of prostatic pressure and blood pressure*

5 Mature male beagles (12-15 kg body weight) were anaesthetised with sodium pentobarbitone (30-50 mg/kg i.v.) and a tracheal cannula was inserted. Subsequent anaesthesia was maintained using pentobarbitone infusion. The animals were respiration with air using a Bird Mk8 respirator (Bird Corp., Palm Springs, CA, U.S.A.) adjusted to maintain blood gasses in the range  $pO_2$  90-110 mm Hg,  $pCO_2$  35-45 mm Hg, pH 7.35-7.45. Body temperature was maintained at 36-37.5°C using a  
10 heated operating table. Catheters were placed into the left femoral artery for recording blood pressure and into the left femoral vein for compound administration. Heart rate was recorded via the lead II E.C.G. A laparotomy was performed to cannulate both ureters to prevent change of fluid volume within the bladder. A 7F cardiac catheter (with a 1.5 ml capacity balloon tip) was inserted into the bladder via  
15 the urethra. The balloon was filled with air and the catheter withdrawn until the balloon became lodged in the prostate, which was confirmed by digital pressure. Balloon pressure was recorded via a Druck transducer. Prostatic pressure and haemodynamic parameters were made on a Grass Polygraph (Grass Instruments, Quincy, Mass, U.S.A.) and the data measured on line using a Motorola 68000-based  
20 microcomputer system (Motorola Inc., Temple, AZ, U.S.A.). Compounds were made up in PEG 300 and administered i.v. through a catheter in the femoral vein. Responses to phenylephrine (1-16  $\mu$ g/kg i.v. in saline) were obtained to generate control dose-response curves (two control curves for each experiment). Compounds were administered (in terms of compound base) at 10-300  $\mu$ g/kg i.v. 5 min before  
25 construction of phenylephrine curves (constructed up to a maximum dose of 128  $\mu$ g/kg in the presence of test compound).

Due to  $\alpha_1$ -related dysrhythmic properties of phenylephrine, absolute maximal responses were not obtained but were taken as 10 % greater than the control response  
30 obtained with 16  $\mu$ g/kg phenylephrine. Drug concentrations were calculated on the basis of molar weight of compound/kg body weight thus allowing a "pseudo  $pA_2$ "

calculation by Schild analysis using dose ratios derived from shifts in the phenylephrine dose-response curves.

The compounds of the invention may have the advantage that they are more potent, have a longer duration of action, have a broader range of activity, are more stable, have fewer side effects or are more selective (in particular they may have beneficial effects in benign prostatic hyperplasia without causing undesirable cardiovascular effects, for example because they are able to selectively antagonise prostatic subreceptors of the  $\alpha_1$ -adrenoceptor), or have other more useful properties than the compounds of the prior art.

10

25 Intermediate 1

1-(t-Butyloxycarbonyl)-1,4-diazepane

To a solution of homopiperazine (100g, 1.0 mol) and triethylamine (210ml, 152g, 1.5mol) in  $\text{CH}_2\text{Cl}_2$  (500ml) at 0°C was added a solution of di-(t-butyl) dicarbonate (195g, 0.89mol) in  $\text{CH}_2\text{Cl}_2$  (300ml). The mixture was allowed to warm to room temperature and stirred for 30 18h after which time the  $\text{CH}_2\text{Cl}_2$  was evaporated under reduced pressure. The resulting residue was partitioned between ether and 2N citric acid and the aqueous layer was extracted with ether (4x200ml). The aqueous layer was basified with 2N aqueous NaOH

and then extracted with  $\text{CH}_2\text{Cl}_2$  (4x400ml). The combined  $\text{CH}_2\text{Cl}_2$  extracts were washed with  $\text{H}_2\text{O}$  (2x), saturated brine (1x) and dried over  $\text{MgSO}_4$ . Evaporation under reduced pressure followed by azeotrope with  $\text{CH}_2\text{Cl}_2$  (4x) gave the title compound as a yellow waxy solid (94.3g, 53%).  $R_f$  0.25 ( $\text{CH}_2\text{Cl}_2/\text{MeOH}/0.88\text{NH}_3$  90/10/1, v/v). 30 H<sub>2</sub>O (2x50ml), and dried over MgSO<sub>4</sub>. Following removal of the solvent, the crude material was purified on silica gel, eluting with hexane/ether (1/1, v/v). This gave the

subtle compound as a colourless gum (252mg, 100%).  $R_f$  0.38 (hexane/ether 1:1, v/v). MS  $m/z$  306 and 308 ( $MNH_4^+$ ).

The solution became warm and some solid precipitated out of solution. After stirring for 30 min at room temperature, 15ml of  $H_2O$  and 2N HCl were added. This mixture was extracted with EtOAc (2x30ml), neutralised using 2N NaOH and re-extracted with EtOAc (2x30ml). The

15

(a) 2,4-Dichloro-6,7-dimethoxy-5-nitroquinazoline

To a suspension of 2,4-dichloro-6,7-dimethoxyquinazoline (30.0g, 0.12 mol) in acetonitrile (550ml) at 0°C was added nitronium tetrafluoroborate (25.9g, 0.19mol) portionwise over 15min. The reaction was stirred for 0.75h and then evaporated under reduced pressure. The resulting solid was suspended in a mixture of saturated aqueous sodium bicarbonate and EtOAc and the solid filtered, dissolved in CH<sub>2</sub>Cl<sub>2</sub>, dried over MgSO<sub>4</sub> and evaporated to give the subtitle compound as a pale yellow solid (27g). Further material was obtained by separating the organic layer of the filtrate, washing with H<sub>2</sub>O (1x), saturated brine (1x), drying over MgSO<sub>4</sub> and filtering through a pad of silica. Subsequent evaporation under reduced pressure, trituration with EtOAc and filtration gave the subtitle compound as a pale yellow solid (3.9g, overall yield 88%). R<sub>f</sub> 0.24 (ether/hexane 1/1, v/v).

(b) 2,4-Dihydroxy-6,7-dimethoxy-5-nitroquinazoline

The product of step (a) (27.3g, 90mmol) was suspended in a mixture of glacial acetic acid (150ml) and H<sub>2</sub>O (5ml) and the reaction mixture was heated to 150°C for 0.5h after which time a further portion of H<sub>2</sub>O (5ml) was added and heating continued. After a total of 1.5h heating, a third portion of H<sub>2</sub>O (5ml) was added and heating maintained for a further 0.5h.

The reaction mixture was then cooled and the solid was filtered, washed with ether and dried in vacuo at 80°C to give the subtitle compound as a pale yellow solid (22.2g, 93%).  $R_f$  0.38 (EtOAc/MeOH 95/5, v/v). MS  $m/z$  285 ( $MNH_4^+$ ).

A mixture of the product of step (b) (35.0g, 0.13mol) and 10% palladium on carbon (4.0g) was suspended in glacial acetic acid (200ml) and hydrogenated at 50psi (3.4 atm) and 50°C for 2.5 days. The reaction was then cooled, suspended in MeOH/ $CH_2Cl_2$  (1/1, v/v, 1L) and filtered. The residue was transferred to a soxhlet apparatus and continually extracted with  
10 MeOH for 3 days. Evaporation afforded a grey solid which was dissolved in 2N NaOH, filtered through a pad of silica, washing with  $H_2O$ . The filtrate was then acidified with concentrated HCl. The resulting precipitate was isolated by filtration, washing sequentially with  $H_2O$  and acetone, then dried in vacuo at 60°C to give the subtitle compound as a white solid (22.7g, 73%).  $R_f$  0.42 (EtOAc/MeOH 95/5, v/v). After cooling, the reaction mixture was partitioned between  $\text{CH}_2\text{Cl}_2$  and  $\text{H}_2\text{O}$  and the aqueous phase was  
20 further extracted with  $\text{CH}_2\text{Cl}_2$ . The combined organic layers were dried over  $\text{MgSO}_4$  and evaporated to afford the subtitle compound as a buff-coloured solid (43.9g, 89%).  $R_f$  0.70 (toluene/EtOAc 4/1, v/v).

(b) 5-Benzylloxy-4-methoxy-2-nitro-benzonitrile

Once the addition was complete, the reaction was stirred for a further 30min, after which time the mixture was poured into  $\text{H}_2\text{O}$  (1L) and stirred for 30min. The resulting precipitate was isolated by filtration, washing

The reaction mixture was then basified with 2N aqueous NaOH and the phases separated. The aqueous layer was extracted twice more with  $\text{CH}_2\text{Cl}_2$  and the combined organic layers dried over  $\text{MgSO}_4$  and concentrated in vacuo to a volume of 60ml. Treatment with excess ethereal HCl led to the
